

PDF Optimizer

PDF Optimizer is a simple scriptable server tool for Windows or Linux platforms that allows you to rework a PDF document so that it will download faster or open more quickly in a browser window. If your goal is to edit a PDF document so that it can be more easily sent out as an attachment to an email message or to allow for faster paging online, you could use PDF Optimizer to reduce the size of the PDF document from, say, 8 MB to 1.5 MB. But the optimization process can also discard objects and features within a PDF document that require excess processing time, making the file more efficient. A complicated PDF document with a lot of features will tend to take more time to load, regardless of the size.

To learn more about how to use PDF Optimizer, find the product documentation on our [Developer's site](#).
